3 ABSTRACT

4 A container body with a container opening and a flap partially secured to the
5 container body and completely covering the container opening is disclosed. The flap is
6 secured to the container by a hinge or fold line and formed from the same substrate as the
7 container body. The container body contains a first magnetic region adjacent to and
8 surrounding the perimeter of the container opening. The flap contains a second magnetic
9 region aligned with and opposite the container body's first magnetic region. The first and
10 second magnetic regions are magnetically attracted to each other. The flap is held in a
11 closed position by magnetic attraction between the flap's magnetic region and the
container body's magnetic region.
